

8. Saturn

Basic facts

Diameter (1) kms (2) Earth radii

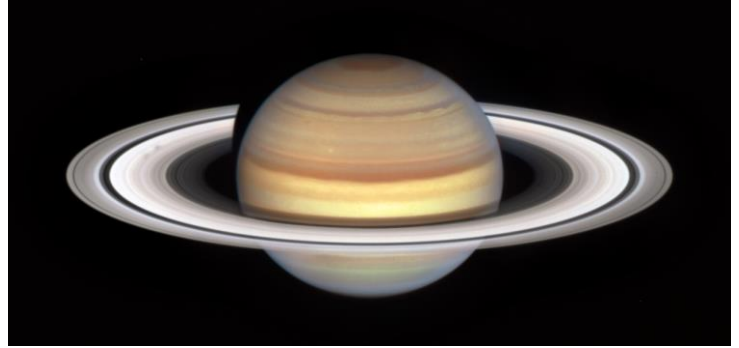

Mass – Earth masses

Distance from the Sun

Year

Day

Number of moons

The ringed planet Saturn [Image: NASA]

Fun Fact

Did you know that Saturn is largely made of hydrogen and helium – the two lightest elements in the universe. As a result Saturn is less dense than water, and, if you had a bathtub big enough, it would actually float!

Description

Eg, 6th planet from the Sun,
When discovered (known in ancient times), when were the rings discovered, what are they made of, coloured bands of clouds. Titan – second largest moon in the solar system – larger than the planet Mercury, has liquid lakes of methane on the surface, visited by the Cassini probe, Enceladus has water below an icy surface – water plumes have been detected
